# URL Shortner

## Summary

You are implementing a service which will allow your users to generate short urls.

- Your service must have multiple companies
- Each company will have multiple users
- Each user will either be an `Admin` or a `Member`

## Requirements

- Use `PHP Laravel` 10 or 11 or 12 as your base framework
- Use `SQLite` or `MySQL` as your database

### Authentication & Authorization

- Setup roles: `SuperAdmin`, `Admin`, `Member`
- Create a `SuperAdmin` account using a Database Seeder
- Allow users to log-in and log-out

### Invitation

- `SuperAdmin` can invite an `Admin` in a new company
- An `Admin` can invite another `Admin` or `Member` in their **own** company

### URL Shortner

- `Admin` and `Member` can create short urls
- `SuperAdmin` **cannot** create short urls
- `SuperAdmin` can see the list of all short urls for every company
- `Admin` can **only** see the list of **all** short urls created in **their own company**
- `Member` can **only** see the list of all short urls **created by themselves**
- **All** short urls should be **publicly resolvable** and redirect to the original url

### Tests

- `Admin` and `Member` can create short urls
- `SuperAdmin` **cannot** create short urls
- `Admin` can **only** see the list of all short urls created in **their own company**
- `Member` can **only** see the list of all short urls **created by themselves**
- Short urls are **publicly resolvable** and redirect to the original url

# Sample Design

A sample reference mockup of the service is available here:
https://drive.google.com/file/d/1ani2g0Jknw3AtqKfU6LP75lRC-7JFCVk/view?usp=sharing

- Please **don't worry** about strictly adhering to the above sample mockups as the mockups contain more features than is required for this assignment
- Feel free to use barebones simple HTML without CSS
- You may also use Laravel auth scaffolding for authentication with Laravel sanctum or Laravel Jetstream to quickly setup authentication workflows

# Submission Instructions

- The assignment should be uploaded to a public GitHub repository
- Create a `README.md` file in the project root directory explaining how to setup the project locally for testing
- Please share this GitHub repo link with us

# Acceptable AI Usage Policy

- You may use AI tools for syntax lookups or debugging, but your overall workflow and reasoning must be original
- When submitting your assignment, please mention any AI tools that you have used, along with their purpose. E.g.
    - Used Cursor for Laravel validation syntax
    - ChatGPT helped me understand and write Eloquent BelongsToMany relationship

- **Submission will be auto rejected if you use AI tools without putting in your own logical efforts at all**
